

Findings:

- The institution has 10 faculty members distributed across 5 roles, however the meaning of these initials is somewhat uncertain.
- Professors with the FA_ST role each have 2 courses, while FA_HOD professors have only one.
- 50% of professors have a workload of 2 courses and 50% have a workload of a single course, this suggests an institutional limit.
- FA_PF has the most senior professors, dating from 2010-2011, being the oldest group (15.6 years on average)
- FA_ST has the newest professors, dating from 2013-2015, being the newest group (11.6 years average)
- This suggests that there have been no recent hires.

Analysis

We can analyze that the institution has a workload limit that prevents teacher burnout, and by having different roles, it suggests a specialization of each teacher in a specific subject. On the other hand, there is a need for staff renewal, because despite having very good staff retention, all of them would be retiring around the same time, which could result in a staffing crisis. Assuming that FT_HOD refers to department heads, it is somewhat unusual that they have a workload of one course.

Conclusions:

- The institution has a significant capacity for staff retention, however, it is aging, with the lack of junior staff hiring being the main risk we identified.
- Course distribution can and should be improved, even though it is currently good.
- There is a high risk of retirement.

Proposals:

- Staff renewal plan: They should begin a process of hiring junior professors, based on calculating a reasonable time for them to acquire skills from senior teachers nearing retirement.
- Evaluate whether department heads could dedicate themselves 100% to department management, having 0 courses assigned, this optimizing their performance.
- Redistribute the workload so that more than 50% of professors end up with only one subject, this through hiring new staff, which could be combined with the first proposal.
